DANIELLE HON

Los Angeles, CA | daniellehon@gmail.com | daniellehon.vercel.app | linkedin.com/in/daniellehon | github.com/daniellehonn

AI-native product engineer: co-founder who co-owns a shipped consumer app's roadmap and builds the AI agents behind it.

EDUCATION

University of California, Los Angeles (UCLA) — **Los Angeles, CA**
Bachelor of Science, Computer Science — **Expected Jun 2028**
Relevant Coursework: Data Structures & Algorithms, Algorithms & Complexity, Discrete Structures, Software Construction

EXPERIENCE

Co-Founder & Founding AI Engineer — **Jul 2023 – Present**
ContextForce (AI startup) · Los Angeles, CA

Forty Pirates: Consumer Web & iOS App for Creators' Travel Videos

- **Co-own the product roadmap** with my co-founder: write **PRDs and user stories** with acceptance criteria, set **success metrics** before building, **prioritize features**, and run product reviews before each launch.
- Built **PostHog** charts on feature usage, **onboarding funnel drop-off**, and crashes, and used them to reprioritize the roadmap, rework onboarding, and ship follow-up fixes.
- Shipped the **React web app and React Native iOS app** on one shared REST API through the **App Store launch**, sitting with beta testers as they tried core flows and turning their feedback into prioritized fixes.
- Built a **multi-agent travel system** where a conductor routes each request to **tool-calling agents** for flights, hotels, and activities over **MCP**, debugging multi-turn conversations from execution traces.
- Turned our ingestion tools into an **agentic workflow**: **SKILL.md playbooks** let agents run the pipeline end to end (search TikTok and YouTube, score batches, query via read-only SQL) behind **6,800+ places** from 2,500+ videos.
- Picked up Swift **within a week** to ship a native SwiftUI share extension, and cut a 9,203-photo scan from an estimated **77 min to under a minute** by profiling on device and writing a Swift native module.

AI Platform (shared across the company's products)

- Built an **evaluation harness** that benchmarks each versioned extraction prompt across models (Gemini, OpenRouter, Groq), logging **latency, tokens, and cost** and grading outputs against a rubric.
- Wrote a **regression test** that diffs production against local output on a ground-truth corpus, catching a **live regression** (2 places returned vs. 7) whose fix had never been deployed.
- Made **7 AI extraction pipelines** more reliable with an **LLM routing layer** that fails over across ordered model tiers before streaming starts, and extended the company's **MCP hub** (9 servers, 38 agent tools).

LEXI: AI Chrome Extension

- **Published** a Chrome extension adding AI actions to YouTube, Gmail, and X, with **40+ prompts** and **Stripe** payments.

Tech Board Director — **Oct 2025 – Present**
Creative Labs @ UCLA (student tech organization) · Los Angeles, CA

- **Lead and mentor 7 developers** on 2 concurrent projects, running weekly **sprint planning**, design reviews, and pull-request **code review**, and explain technical decisions to club leadership and non-technical teammates.
- Built a **membership portal now used by 100+ members** with a product manager and the design team, shaping features by watching members use it, and migrated 40+ teams' data into a **normalized PostgreSQL schema**.

SELECTED PROJECTS

et al. – Open-Source Knowledge Base for AI Agents — **Jul 2026 – Present**
TypeScript, MCP, Cloudflare Workers/D1/Vectorize/Queues, Workers AI, Hono, Next.js, Zod, Vitest

- Built a knowledge base where agents like **Claude Code** capture links, file notes, and manage tasks through **18 MCP tools**, holding each AI edit as a diff **until a human approves it**; I use it daily.
- Raised LLM extraction recall from **62% to 79–85%** at **84% precision** by building a **20-fixture eval** that traced silent failures to invalid model JSON, then fixing them with schema-constrained decoding.
- Redesigned the prototype around five fixed entity types, cutting **~5,300 lines** and **57 agent tools to 18**, then wrote **93 integration tests** (92% server coverage) that run in CI and before every deploy.

Plan My Courses – Interactive Degree Planner — **Jun 2025 – Present**

- Cut quarter-planning time by **80%** in testing with **30+ UCLA students** by modeling prerequisites as a dependency graph, shipping changes based on their feedback.
- Rebuilt scheduling as an **integer program** in a Web Worker, proving optimal plans in 9 of 10 benchmark scenarios in **under a second**, guarded by a **94-test CI suite**.

Pagewise – Cited Q&A over Web Pages — **Oct 2026**

- Built a **Java Spring Boot RAG service** (LangChain4j, pgvector in Docker) that answers with cited sources, using the Strategy pattern to swap vector stores, plus 14 JUnit tests.

SKILLS & AWARDS

Product: Roadmaps, PRDs, user stories & acceptance criteria, prioritization, success metrics, user observation, PostHog
Agentic & AI: Multi-agent orchestration, tool calling, MCP, SKILL.md playbooks, LLM evals, model routing, RAG, Claude Code
Engineering: TypeScript, Python, Java, Swift, SQL, C++; React, React Native, Next.js, Spring Boot; PostgreSQL, Docker
Languages: English, Cantonese | **Awards & Activities:** NCWIT Award for Aspirations in Computing (2024), LA Hacks (2026)
